unlike some other reproductions of classic texts 1 we have not used ocr optical character recognition as this leads to bad quality books with introduced typos 2 in books where there are images such as portraits maps sketches etc we have endeavoured to keep the quality of these images so they represent accurately the original artefact although occasionally there may be certain imperfections with these old texts we feel they deserve to be made available for future generations

anyone who observes fruit trees may wonder how or why they behave in specific ways some trees grow upright while others have a spreading habit some produce many flowers and small immature fruit only to drop most of the fruit later on others grow more strongly on their sunny side than their shady side it is common to ascribe such behavior to the tree as a whole and state that trees preferentially allocate resources to specific organs however this is the wrong approach to understanding tree functioning and behavior trees are not in control of what they do what trees do and how they function is shaped by the individual organs that make up the tree not by the tree as a whole the genetic code only indirectly determines the habit structure and behavior of a tree by defining the behavioral and functional limits of the component organs tissues and cells unlike animals that have a mechanism for collective control of the whole organism a central nervous system trees and plants in general are more appropriately considered as collections of semi autonomous organs these organs are dependent on one another for resources such as water energy and nutrients but control their own destiny this book presents a clear set of integrative concepts for understanding the overall physiology and growth of temperate deciduous fruit trees the emphasis is on overarching principles rather than detailed descriptions of tree physiology or differences among the numerous species of fruit trees although the focus is on deciduous fruit trees many aspects apply to evergreen fruit trees and trees that grow naturally in unmanaged situations
